Firewall

Internet   **Attacks**   **Firewall**   **Private Networks**

## KCi Services: Firewall

- A firewall is a security system that monitors and controls incoming and outgoing network traffic based on predetermined security rules. It is crucial for protecting networks from unauthorized access, cyberattacks, and data breaches.

- Firewalls help ensure the integrity and confidentiality of sensitive information by establishing a barrier between trusted internal networks and untrusted external networks

This system will help:
- Prevent intruders from accessing sensitive data
- Monitor traffic
- Set security policies
- Detect and block malicious software before it enters the network
